

Very Large Array Sky Survey Cutout Generator and Data Analysis

THE UNIVERSITY
OF THE
WEST INDIES

By: Jason D. Renwick BSc.
NRAO NINE Participant 2018

Supervised by: Dr. Brian Kent (Technical)
Anja Fourie (Project Management)

Who am I?

- Jason D. Renwick BSc.
 - Electrical and Computer Engineering (May 2018)
 - The University of the West Indies
- NRAO NINE Program
 - National and International Non-traditional Exchange
 - Data Analysis
 - Project Management
- Previous Research Internships in:
 - Prognostics/Electronics
 - Software and Image Stitching
 - Geospacial and Drone Imagery

Where is Trinidad?

Presentation Contents

- Overview of the NINE Program
- VLASS Dataset Summary
- My Summer project
- Lessons Learnt and moving forward

All astronomical images in this presentation have been sized to 2 arcminutes

NRAO NINE Program

Mission:

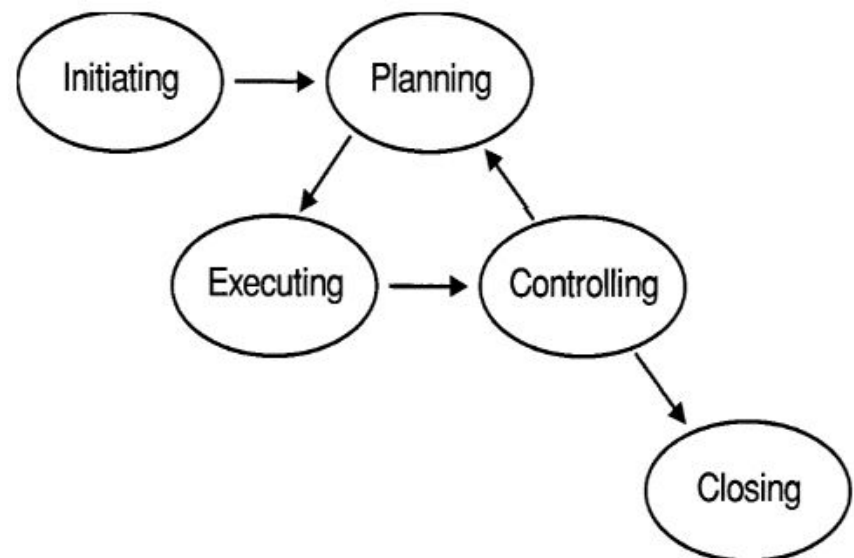

“The NRAO NINE program has a vested interest in building a pipeline of talent within the radio astronomy field, and within under-represented communities. The anticipated outcome of this program will be worldwide partnerships with fast growing radio astronomy communities designed to facilitate the exchange of NINE trainers and the co-mentoring of under-represented groups of learners.”

- Step 1: Hands-On Experience
- Step 2: Mentoring/Teaching Techniques
- Step 3: ‘NINE Hub Program’ Development
- Step 4: NINE Hub Program Exchanges

NRAO NINE Program

- Low-cost computing
 - Raspberry Pi 3
- Opensource resources
 - Python, AstroPy
 - VLASS Quicklooks
- Project Management
 - Accountable
 - Iterative
 - Resilient
 - Confident

Very Large Array Sky Survey (VLASS): Overview

- All-sky (33,885 deg² above declination -40°)
- Frequency: 3 GHz (2–4 GHz, less RFI affected regions)
“S-band”
- High angular resolution: 2.5” (VLA B/BnA-configurations)
- Synoptic: 3 epochs separated by 32 months
- Uses OTF (On-The-Fly) mosaicking
- Status: observed first half of first epoch ($\sim 17,000$ sq. deg.)
Sep 2017 through Feb
- 2018, delivered 16,500 sq. deg. of “Quick Look” images
(17538 FITS)

VLASS Compared to NVSS

- Angular Resolution:
 - NVSS: 45 arcsecond
 - VLASS: 2.5 arcsecond

Technologies Used

- Back-End
 - Model View Controller - Django (python)
 - MySQL Database
 - AstroPy
 - Web Crawler
- Front-End
 - HTML + CSS for static information
 - Javascript for interactions
 - Aladin Lite for Optical/IR Images
- System
 - Raspberry Pi 3

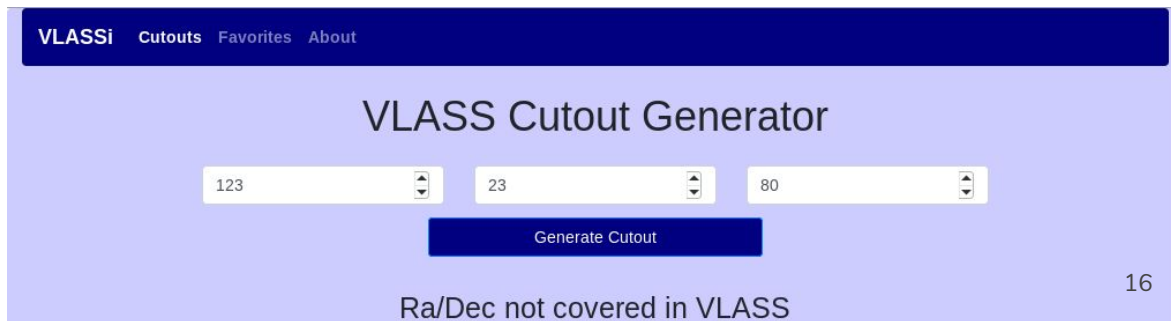

Features

- Input Limits:
 - $0 \leq \text{RA (deg)} < 360$
 - $-90 < \text{Dec (deg)} < 90$
 - $10 < \text{Width (arcsec)} < 1000$
- VLASS Coordinate Search
 - Determines if the input RA/Dec is covered by VLASS (so far)

- handles up to 20 simultaneous queries

- Keeps a cache of 20 VLASS files (1gb)

Features - Optical and IR

Radio (VLASS)

Optical (DSS2 Blue+Red+nIR)

Infrared (2MASS H+J+K)

Live Demo:

<http://192.168.160.194:8000/>

RA= 156.192059, Dec= -18.642329

Features....Coming Soon

- Generate FIT with raw data
 - Include a download button
- Create a user-base with cutout history
- Deploy on WWW

Lessons Learnt

- Measure twice, cut once
 - Especially when it takes 120 hours to 'cut'
- Divide 'impossible' tasks to manageable sizes
- Document your code during development
- 'Git commit' often with meaningful messages

Knowledge Transfer

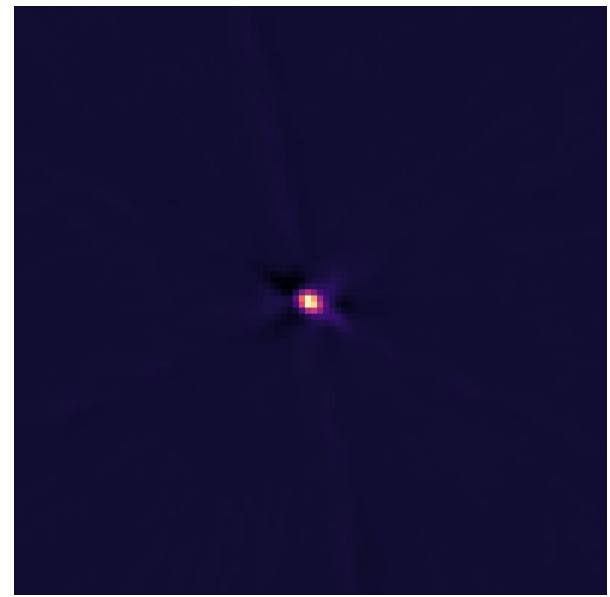

- Tutorials
 - Intro to Python
 - Using a Raspberry Pi
 - Retrieving and Manipulating VLASS Data
- Postgraduate research

Future Work - Positional Accuracy

RA: +0.3937''

Dec: +0.4268''

Future Work

- Training a Convolutional Neural Network (CNN) to recognize point sources or radio jets
- Quantify morphology of galactic structures with computer vision techniques e.g. blob detection or gaussian fitting
- Search the dataset for new sources not recognized in NVSS
 - With thresholding or CNN
- Search for transient between VLA FIRST and VLASS

Thank You!
